

Lights flickering?

When your lights flicker, it could be a signal you have a big problem. As a homeowner, it's not your duty to try and solve your lighting problems. That should be left to a professional electrician. A professional electrician can troubleshoot your lighting. Troubleshooting is what Electrical Connections does to properly diagnose lighting problems.

Lighting is essential to every home in America. Frankly, we need it for better viewing and to see our way throughout the house. When there's problems with the lighting, our homes can become difficult places to be...sort of like caves. Not good.

Here are some electrical problems that are often associated with flickering lighting:

- Bad switch
- Wire issues
- Fixture has damage

Also, if you smell smoke, your wiring may be having issues. New lighting installed on old wiring can be a ticking bomb just waiting to burn your home down. Combined they can become a deadly force. You don't want to go to sleep at night not knowing if a fire may happen before you awaken. Scary.

**Call Electrical
Connections right now.
Don't take a chance
with fire...or your
safety.**
